Project 3 Write Up

This assignment took more brainstorming than actual implementation. I was having a hard time trying to think of an interesting way to incorporate Javascript into my webpage. Eventually, I had a basic idea in my head and I am happy to say the finished product is very similar to the idea I had in my head. Using bootstrap this time was much easier than the last time and I actually enjoyed using it. I also realized how useful the web inspector tool is on the browser. It helped me find a lot of css details that I could not understand before. Learning Javascript was relatively easy once I understood the style. It's somewhat similar to other programming languages so it was not as hard to pick up as html. Once I saw the sample code it was pretty easy to move some stuff around to work with my conversions. I realized that images with transparent backgrounds look great on the webpage so I spent some time trying to find pictures of the planets with transparent backgrounds. Other than that, this project was more pleasant than previous projects because I learned how to cooperate with the bootstrap template better.
